## CLAIMS

1. A process for producing a light absorbing layer for a chalcopyrite type thin-film solar cell, characterized in that the process comprises:

a precursor forming step of superimposing on a backside electrode layer formed on a substrate, an In metal layer adjacent to the electrode layer and a Cu-Ga alloy layer by sputtering;

a first selenization step of accommodating the precursorformed substrate in an airtight space and introducing hydrogen selenide gas into the airtight space conditioned to a temperature in a range from room temperature to 250°C;

a second selenization step of heating an interior of the airtight space to a temperature in a range from 250° to 450°C and additionally introducing hydrogen selenide gas into the airtight space;

a third selenization step of heating an interior of the airtight space to a temperature in a range from 450° to 650°C, and performing heat treatment of the substrate under the above temperature conditions, while causing the hydrogen selenide gas introduced up to the second selenization step to remain in the space; and

a cooling step of cooling the substrate after the heat treatment.

2. The process for producing the light absorbing layer for the chalcopyrite type thin-film solar cell according to claim

- 1, characterized in that the second selenization step includes an evacuating step of interrupting the supply of hydrogen selenide gas and evacuating the interior of the airtight space.
- 3. The process for producing the light absorbing layer for the chalcopyrite type thin-film solar cell according to claim 1, characterized in that hydrogen selenide gas is continuously supplied immediately after the first selenization step and in the second selenization step.
- 4. The process for producing the light absorbing layer for the chalcopyrite type thin-film solar cell according to any one of claims 1 to 3, characterized in that the substrate is accommodated almost in an upright position in a cabinet rotatably disposed in the airtight space and the cabinet is rotated in at least one of the first, second, third selenization steps and the cooling step.
